Kyriba TMS Transformation

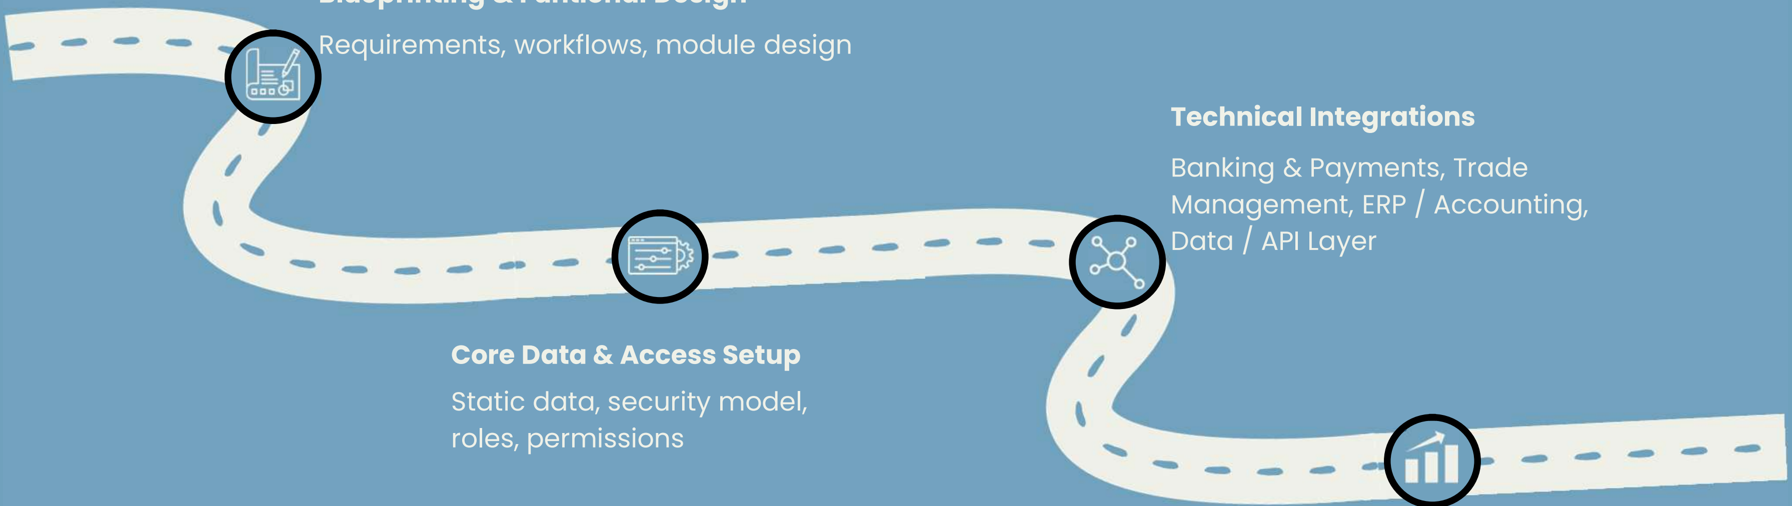
End-to-End Implementation & Process Optimization

Executive overview highlighting full Kyriba implementation, technical analysis of consultant configurations, Open API integration with centralized data platform and accounting ERP integration.

Strategic Overview

This initiative delivered a full end-to-end implementation of the Kyriba Treasury Management System, covering everything from initial TMS selection through blueprinting, core data configuration, access setup, integrations, and value-added process improvements.

Roadmap



Blueprinting & Funtional Design

Requirements, workflows, module design

Core Data & Access Setup

Static data, security model, roles, permissions

Technical Integrations

Banking & Payments, Trade Management, ERP / Accounting, Data / API Layer

Optimisation & Continuous Improvement

Controls, reconciliations, reporting, efficiency

Core Role & Hands-On Ownership

Bridging treasury requirements, Kyriba solution design and hands-on system ownership

Functional lead and technical validator.

Led functional design and requirements validation, translating treasury needs into Kyriba solutions and reviewing workflows, mappings and system logic

Process optimisation and workflow design.

Designed and enhanced workflows across payments, accounting and reporting, leveraging Kyriba automation to streamline processes and reduce manual intervention

Ownership of improvements post-go-live

Managed enhancements, fixes and optimisation cycles as System Administrator, ensuring the Kyriba solution continued to evolve with changing treasury requirements

Part 1 — Blueprinting & Functional Design

Translating treasury requirements into functional design

From Treasury Requirements to Kyriba Design

Functional Design Approach

Treasury Business Role: treasury SME, deep understanding of operational treasury processes, requirements and pain points
Stakeholder Alignment: worked with key stakeholders to translate strategic objectives into practical requirements
Business-to-System Bridge: connected Treasury's operational needs with Kyriba's functional capabilities

Functional Scope

Trade processing: trade capture and processing
Banking and payments: bank connectivity, payments and statements
FX integration: front to back integration
Cash management: balances, cash flows and visibility
Accounting: requirements and ERP connectivity
Reporting: bespoke reporting and API connectivity
Controls and approvals: security and segregation of duties

Functional Design in Practice

1

Requirements & Stakeholder Alignment

Documented detailed operational requirements
Challenged existing processes and identified pain points
Translated Treasury needs into functional specifications

2

Workflow & Process Design

Designed end-to-end treasury workflows
Defined approval and control points
Identified opportunities to simplify manual activities

3

Translate Requirements into Kyriba

Mapped requirements to Kyriba functionality
Defined functional behaviour, rules and configuration requirements
Reviewed and challenged consultant-designed solutions

4

Testing & Functional Validation

Reviewed configuration against requirements
Supported functional and end-to-end testing
Confirmed that the solution worked from the Treasury user's perspective

Translated treasury requirements into practical Kyriba solutions, balancing operational needs, controls and system capabilities.

Part 2 — Core Data & Access Setup

Establishing the data, security and governance foundation for Kyriba

Building the Kyriba Data Foundation

Establishing the core data and configuration required to support Treasury

Master Data Definition

Completed and validated Kyriba-provided templates for entities, banks, bank accounts and third parties
Established relationships between core data objects
Validated data structures against Treasury operating requirements

System Configuration

Defined main and system currencies
Established transaction types and relevant product structures
Defined product subscriptions according to business and user requirements

Data Quality & Validation

Reviewed data before system loading
Validated configuration against business requirements
Ensured consistency across entities, accounts and third parties

Established the core data model required to support Treasury operations, connectivity and reporting within Kyriba

Access, Controls & Self-Service

Establishing a controlled access model with Treasury-led system administration

User Profiles

Defined access requirements across different user types: as an example Client User, Treasury User, Admin User or View-Only User

Approval & Control Framework

Defined approval workflows
Established segregation of duties
Aligned permissions and approval levels with Treasury controls

Roles & Permissions

Designed role-based access
Defined permissions according to responsibilities
Established appropriate access boundaries
Aligned access with segregation-of-duties requirements

Treasury-Led Administration

Treasury Operations maintained day-to-day Kyriba administration
Managed users, roles, permissions and system data
Performed ongoing configuration and maintenance
Escalated technical components requiring IT support

Designed a controlled access model while enabling Treasury to independently maintain and evolve the Kyriba environment.

Part 3 — Technical Integrations

Connecting Kyriba to the wider Treasury and financial ecosystem

Integration Landscape

Banking & Payments

- Payment processing
- Bank statements
- Reconciliations

ERP / Accounting

- Cash Accounting
- Financial Accounting
- ERP integration

Kyriba

Central treasury platform connecting operational, financial and market ecosystems

Trade Management

- Trading platforms
- Trade capture
- Custodian bank connectivity

Data / API Layer

- API connectivity
- Open API
- Market data

Designed and validated interfaces connecting Kyriba with banks, trading platforms, custodians and ERP systems

Banking & Payments

Connecting bank data and payments to Kyriba for cash visibility and reconciliation

Flow	My Role
Statements - camt.053	Worked with banks and implementation team to set up connectivity and validate configuration; tested statement delivery, format and transaction information
Payments - pain.001 / pain.002	Supported payment connectivity setup and testing; executed test payments and validated bank transmission, responses and payment status
Reconciliations - BTC Mapping & Rules	Configured and validated BTC mappings and reconciliation rules; monitored the Bank Connectivity Cockpit, investigated breaks and tested matching behaviour.

Tade Management

Connecting trade execution, Kyriba trade capture and post-trade processing

Flow	My Role
FX Platform	Worked with the implementation team to configure Kyriba templates, engaged with the FX platform provider, analysed executed trades and iterated through testing until final validation.
Money Market Funds Platform	Worked across Kyriba and the MMF platform provider to validate the connectivity, tested trades and confirmed the end-to-end processing.
Manual Trade Entry - Internal Clients	Defined and validated manual trade-entry requirements for transactions initiated by internal Treasury users; tested capture, processing and downstream behaviour
Custodian Bank - Post-Trade Processing	Defined transaction-specific requirements through custodian templates, engaged with the custodian and implementation team, tested transaction flows and exceptions, and validated the final solution

ERP / Accounting

Translating Treasury activity into controlled accounting processes and ERP data

Flow	My Role
Cash Accounting - setup, GL generation & approval	Worked with Finance to define cash accounting requirements and transaction mappings; reviewed and improved configuration, documented the process from GL generation through review and approval, improved robustness and reduced ongoing maintenance.
Financial Accounting - setup, Accruals, MTM, GL generation & approval	Worked with Finance and the Kyriba team on financial transaction templates and configuration; reviewed, mapped and improved the setup, created procedures and documented the end-to-end process from accruals and MTM through GL entries and approval.
ERP Connectivity - Open API & Data Platform	Worked with IT to define the required Kyriba data template for Open API extraction; validated the output and tested the data through the data platform

Data / API Layer

Ensuring reliable financial and market data for downstream Treasury use

Flow	My Role
API connectivity - Standard Kyriba Data	Validated available API data, tested outputs and identified gaps against Treasury requirements.
Open API - Financial Transactions	Defined additional financial transaction data requirements, created the data template, tested the output and validated the enhanced data set.
Market data - FX rates & forwards and Interest rate curves	Defined required market data, validated sources and outputs, tested and documented data requirements, and maintained new data requirements such as MMF rates

Part 4 — Optimisation & Continuous Improvement

Turning the implemented Kyriba solution into a more efficient, user-friendly and scalable Treasury platform.

Optimising User Experience

Improving navigation, visibility and usability across Treasury workflows

Improvement	My Role
Navigation & Menus	Simplified menu structures and created shortcuts to make frequently used functions easier to access.
User Dashboards	Created personalised dashboards giving clients a clear view of positions and key Treasury information.
Custom Views & Templates	Built tailored views and templates for new, historical and outstanding trades, improving visibility and day-to-day monitoring.
Transaction Input Screens	Created personalised input screens based on transaction type and user requirements.

Process Improvement

Turning repetitive Treasury activities into scalable, controlled workflows

Improvement	My Role
Automated Client Reporting - Trades, Positions, Balances and Interest	Designed reporting requirements and automated delivery processes, ensuring clients received the information they needed without manual intervention.
Automated Trade Confirmations — CSV & Email Delivery	Designed and validated the trade-confirmation workflow, including CSV output and email-only recipients, enabling automated distribution to fund administrators without consuming full user licences.
