

KYRIBA TRANSFORMATION | CASE STUDY 02

Payments Connectivity

Removing manual file handling from global treasury payments

A case study in process redesign, bank integration, and payment automation.

How Treasury Payments Work

The netting cycle behind every payment, and where third party payments and treasury transfers fit

Before this project, these payments were sent with manual file uploads, bank portals and faxes.

How Netting Works

Group entity transactions stay inside Kyriba. Only the netted amounts go out as payments.

Cash moves through the bank only when it enters or leaves Treasury. Payments between entities are netted inside Kyriba.

From Manual Files to Direct Bank Connectivity

How payments moved from manual uploads to a direct bank connection

Before | Manual process

1. Netting is automatic; report downloaded manually
2. File downloaded and re-uploaded to the legacy TMS, which sends payments to the bank: **manual handling**
3. Third party and other non-netted payments **instructed** manually in the **bank portal**
4. Treasury transfers between Bank A and Bank B instructed manually (portal, or fax and email to the Bank B team)
5. Payments checked manually in the bank portal, then sent for approval

After | Bank connectivity

1. Netting process is **scheduled** (or can be manually triggered by the user) in Kyriba
2. Third party payments **instructed in Kyriba** via templates directly in the Payments module
3. Treasury transfers between Bank A and Bank B **instructed** in the Cash & Liquidity module in **Kyriba**
4. Payments reviewed and sent for approval
5. Once approved, **pain.001** goes to Bank A (or to Bank B for treasury transfers from Bank B to Bank A)
6. Kyriba receives **pain.002** feedback from the bank; the bank also emails feedback on the XML file

How the Integrated Payments Flow Operates

Business Impact

OPERATIONAL RISK

2

core banks connected straight-through

Before: the netting file was downloaded, reloaded into the legacy TMS and sent to the bank portal.

EFFICIENCY

~6 h

saved per month ~15 min per payment run

At least 5 min saved on each treasury transfer and third party payment. Fax transfers save more.

CONTROL

1

place to approve all payments

Before: Bank A portal, fax to Bank B and email to the Bank B team.

Estimate based on one payment run per working day (about 21 a month), 6 treasury transfers and 5 third party payments a month.
