

Kyriba TMS Transformation

End-to-End Implementation & Process Optimisation

Executive overview highlighting full Kyriba implementation, functional analysis of solution design, Open API integration with the centralised data platform and ERP integration.

Strategic Overview

This initiative delivered an end-to-end implementation of Kyriba Treasury Management System (TMS), covering TMS selection, blueprinting, core data configuration, access setup, integrations, and targeted process improvements.

Roadmap

Blueprinting & Functional Design

Requirements, workflows, module design

Technical Integrations

Banking & Payments, Trade
Management, ERP / Accounting,
Data / API Layer

Core Data & Access Setup

Static data, security model,
roles, permissions

Optimisation & Continuous Improvement

Controls, reconciliations,
reporting, efficiency

Core Role & Hands-On Ownership

Bridging treasury requirements, Kyriba solution design and hands-on system ownership

Functional lead and solution validator.

Led functional design and requirements validation, translating treasury needs into Kyriba solutions and reviewing workflows, mappings and system logic

Process optimisation and workflow design.

Designed and enhanced workflows across payments, accounting and reporting, leveraging Kyriba automation to streamline processes and reduce manual intervention

Ownership of improvements post-go-live

Managed enhancements, fixes and optimisation cycles as System Administrator, ensuring the Kyriba solution continued to evolve with changing treasury requirements

Part 1 — Blueprinting & Functional Design

Translating treasury requirements into functional design

From Treasury Requirements to Kyriba Design

Functional Design Approach

Treasury Business Role: Treasury SME with a deep understanding of operational Treasury processes, requirements and pain points

Stakeholder Alignment: worked with key stakeholders to translate strategic objectives into practical requirements

Business-to-System Bridge: connected Treasury's operational needs with Kyriba's functional capabilities

Functional Scope

Trade processing: trade capture and processing

Banking and payments: bank connectivity, payments and statements

FX integration: front to back integration

Cash management: balances, cash flows and visibility

Accounting: requirements and ERP connectivity

Reporting: bespoke reporting and API connectivity

Controls and approvals: security and segregation of duties

Functional Design in Practice

Translated treasury requirements into practical Kyriba solutions, balancing operational needs, controls and system capabilities.

1

Requirements & Stakeholder Alignment

Captured detailed operational requirements
Challenged existing processes and identified pain points
Converted Treasury needs into functional specifications

2

Workflow & Process Design

Designed end-to-end treasury workflows
Established approval and control points
Identified opportunities to simplify manual activities

3

Translate Requirements into Kyriba

Mapped requirements to Kyriba functionality
Established functional behaviour, rules and configuration requirements
Reviewed and challenged consultant-designed solutions

4

Testing & Functional Validation

Reviewed configuration against requirements
Supported functional and end-to-end testing
Confirmed that the solution worked from the Treasury user's perspective

Part 2 — Core Data & Access Setup

Establishing the data, security and governance foundation for Kyriba

Building the Kyriba Data Foundation

Establishing the core data and configuration required to support Treasury

Master Data Definition

Completed and quality-checked Kyriba-provided templates for entities, banks, bank accounts and third parties
Established relationships between core data objects
Confirmed data structures aligned with Treasury operating requirements

System Configuration

Set main and system currencies
Established transaction types and relevant product structures
Aligned product subscriptions with business and user requirements

Data Quality & Validation

Reviewed data before system loading
Checked configuration against business requirements
Ensured consistency across entities, accounts and third parties

Established the core data model required to support Treasury operations, connectivity and reporting within Kyriba

Access, Controls & Self-Service

Establishing a controlled access model with Treasury-led system administration

User Profiles

Defined access requirements across different user types: for example, Client User, Treasury User, Admin User or View-Only-User

Roles & Permissions

Designed role-based access
Defined permissions according to responsibilities
Established appropriate access boundaries
Aligned access with segregation-of-duties requirements

Approval & Control Framework

Defined approval workflows
Established segregation of duties
Aligned permissions and approval levels with Treasury controls

Treasury-Led Administration

Treasury Operations maintained day-to-day Kyriba administration
Managed users, roles, permissions and system data
Performed ongoing configuration and maintenance
Escalated technical components requiring IT support

Designed a controlled access model while enabling Treasury to independently maintain and evolve the Kyriba environment.

Part 3 — Technical Integrations

Connecting Kyriba to the wider Treasury and financial ecosystem

Integration Landscape

Designed and validated interfaces connecting Kyriba with banks, trading platforms, custodians and ERP systems

Banking & Payments

Connecting bank data and payments to Kyriba for cash visibility and reconciliation

Flow	My Role
Statements – camt.053	Set up and validated bank connectivity with banks and the implementation team; tested statement delivery, format and transaction information.
Payments – pain.001 / pain.002	Supported payment connectivity setup and testing; executed test payments and validated bank transmission, responses and payment status.
Reconciliations – BTC Mapping & Rules	Configured BTC mappings and reconciliation rules; monitored the Bank Connectivity Cockpit, investigated breaks and tested matching behaviour.

Trade Management

Connecting trade execution, Kyriba trade capture and post-trade processing

Flow	My Role
FX Platform	Worked with the implementation team to configure Kyriba templates , engaged with the FX Platform provider, analysed executed trades and iterated through testing until final validation .
Money Market Funds Platform	Coordinated with Kyriba and the Money Market Funds platform provider to validate the connectivity, tested trades and confirmed the end-to-end processing .
Manual Trade Entry – Internal Clients	Defined and validated manual trade-entry requirements for transactions initiated by internal Treasury users; tested capture, processing and downstream behaviour.
Custodian Bank – Post-Trade Processing	Established transaction-specific requirements through custodian templates, engaged with the custodian and implementation team, tested transaction flows and exceptions, and validated the final solution .

ERP / Accounting

Translating Treasury activity into controlled accounting processes and ERP data

Flow	My Role
Cash Accounting – setup, GL generation & approval	Worked with Finance to define cash accounting requirements and transaction mappings ; reviewed and improved configuration , documented the process from GL generation through review and approval, improved robustness and reduced ongoing maintenance.
Financial Accounting – setup, Accruals, MTM, GL generation & approval	Refined financial transaction templates and configuration with Finance and the Kyriba team; reviewed, mapped and improved the setup, created procedures and documented the end-to-end process from accruals and MTM through GL entries and approval.
ERP Connectivity – Open API & Data Platform	Established the Kyriba data template required for Open API extraction with IT; checked the output and tested the data through the data platform.

Data / API Layer

Ensuring reliable financial and market data for downstream Treasury use

Flow	My Role
API connectivity – Standard Kyriba Data	Validated available API data , tested outputs and identified gaps against Treasury requirements.
Open API – Financial Transactions	Identified additional financial transaction data requirements , created the data template, tested the output and confirmed the enhanced data set.
Market data – FX rates & forwards and Interest rate curves	Specified required market data , assessed sources and outputs, documented data requirements, and maintained new data requirements such as Money Market Funds rates

Part 4 — Optimisation & Continuous Improvement

Turning the implemented Kyriba solution into a more efficient, user-friendly and scalable Treasury platform.

Optimising User Experience

Improving navigation, visibility and usability across Treasury workflows

Improvement	My Role
Navigation & Menus	Simplified menu structures and created shortcuts to make frequently used functions easier to access.
Transaction Input Screens	Tailored personalised input screens based on transaction type and user requirements.
User Dashboards	Created personalised dashboards giving clients a clear view of positions and key Treasury information.
Custom Views & Templates	Built tailored views and templates for new, historical and outstanding trades, improving visibility and day-to-day monitoring.

Process Improvement

Turning repetitive Treasury activities into scalable, controlled workflows

Improvement

My Role

**Automated Client Reporting –
Trades, Positions, Balances and
Interest**

Designed reporting requirements and automated recurring delivery, ensuring clients received the information they needed without manual intervention.

**Automated Trade Confirmations
— CSV Distribution to Fund
Administrators**

Designed and validated the trade–confirmation workflow, including CSV output and email-only users, enabling automated distribution to fund administrators **without requiring full user licences**.
